This first assignment will help you learn to use the Linux computers administered by OU Information Technology for the College of Engineering. An account should have been set up for you automatically. If you have trouble accessing your account, then you MUST contact Dr. Neeman by no later than Wednesday Aug 29. You MUST be enrolled in CS1313 to get an account.

Actions and commands that you should perform or type are in the computer boldface font. Your user name is denoted here as yourusername, but will actually be your OU4+4 ID (the first 4 letters of your last name in all lower case, followed by the last 4 digits of your OU ID number.

For each step in this project specification, you should do the following, IN THE FOLLOWING ORDER:

1. **READ** the full text of that step.
2. **DO** what the full text of that step says to do.
3. **ASK** questions about anything that’s unclear about that step.

The requirements for this assignment are listed on the following pages.
I. LOG IN

1. Connect and log in, from a computer that you’re sitting at, to:
   ssh.ou.edu

   (a) From a PC in Carson Engineering Center 205, 206 or S-18:
       i. Press Ctrl-Alt-Delete simultaneously.
       ii. This will take you to the Logon Banner screen. Click the OK button or press the Enter key on the keyboard.
       iii. This will take you to the logon screen. CAREFULLY CHECK whether a username has already been selected for you — that is, just above the text box for the password, is there a text box for a username, or your username (your OU4+4), or some other username (that is, the WRONG USERNAME)?
       iv. If the wrong username is shown, then below the text box for the password, click the Switch User button.
       v. If you clicked the Switch User button, you should then click the Other User button.
       vi. Type your OU4+4 username and password in the appropriate text boxes.
       vii. Click the → button or press the Enter key on the keyboard.
       viii. Wait patiently while the PC logs you in and starts up various features.
       ix. You will now want to run a program named PuTTY, which lets you log in remotely to the computer that we’re going to use.
           A. On the bottom left of the screen, click on the icon for your preferred web browser (for example, Firefox, Chrome, Microsoft Edge).
           B. In the web browser, go to the CS1313 website:
               http://cs1313.ou.edu/
           C. Scroll down almost to the bottom of the page, to the section titled USEFUL INFORMATION
           D. Click on the following link:
               Downloading a Secure Shell Client to Your Desktop
           E. Follow the instructions to download and run putty.exe (the 64-bit version).
           F. Double-click on the PuTTY icon on your desktop (or wherever you’ve saved it).
       x. That’ll pop up a window titled PuTTY Configuration
           On the left side of the window, under the heading Terminal, is an entry
           Keyboard
           Click on it.
xi. This will bring up a section titled
Options controlling the effects of keys
Under this is a heading
Change the sequences sent by:
and beneath that is
The Backspace key
Click to select
Control-H

xii. A bit lower is
The Function keys and keypad
Click to select
Xterm R6

xiii. On the left side of the PuTTY Configuration window, below
Terminal
and its subentries, is an entry
Window
Click on it.

xiv. This will bring up a section titled
Options controlling PuTTY’s window
The first option is
Set the size of the window
Choose \textbf{EXACTLY} 80 columns (which is the default) and \textbf{EXACTLY} 40 rows
(which \underline{isn’t} the default, so you’ll have to change it).

xv. Below that is an option
When window is resized:
Click on
\textbf{Forbid resizing completely}
\textbf{NEVER RESIZE THE PUTTY WINDOW USING THE MOUSE, AND NEVER CLICK THE MAXIMIZE BUTTON AT THE TOP RIGHT OF THE WINDOW.}

xvi. On the left side of the PuTTY Configuration window, below
Window
is a subentry
\textbf{Translation}
Click on it.

xvii. This will bring up a section titled
Options controlling character set translation
Below that is a section titled
Character set translation
and below that is a menu titled
Remote character set:
In that menu, select
\textbf{UTF-8}
xviii. On the left side of the PuTTY Configuration window, the first entry is **Session**
    Click on it.

xix. This will bring up a section titled **Basic options for your PuTTY session**
    The first option is **Specify the destination you want to connect to**
    and immediately below it is **Host Name (or IP address)**
    In the text box immediately below that, type the full name of the computer that
    you are logging into: **ssh.ou.edu**

xx. Immediately below this is **Connection type:**
    below which make sure that **SSH**
    is selected (it should be the default, so you shouldn’t need to click on it).

xxi. At the bottom right of the PuTTY Configuration window, click **Open**

xxii. If a PuTTY Security Alert window pops up, click **Yes**

xxiii. When prompted to **login as**, type your OU4+4 username with **ALL LETTERS IN LOWER CASE** (small), and then press **Enter**

xxiv. When prompted for your password, type your OU4+4 password, which **DOESN’T** have to be all lower case) and press **Enter**
    **NOTHING WILL APPEAR AS YOU TYPE YOUR PASSWORD.** This is normal for Unix.

xxv. **NOTE:** When you log out of a Windows PC in Carson 205, 206 or S-18, your PuTTY settings may be lost, in which case you’d have to redo all these settings each time.

(b) **From your own Windows PC, or from a Windows PC not in Carson 205, 206 or S-18:** You will need to download the PuTTY SSH client onto your desktop. Follow the instructions above, starting from Step I.1(a)ix.

(c) **From your own Apple Mac or a Unix/Linux computer, or a Mac or Unix/Linux computer not in Carson 205, 206 or S-18:**
    You should be able to access the command **ssh** from the Unix command line, like so:
    ```
    > ssh yourusername@ssh.ou.edu
    ```
    where **yourusername** is your user name (that is, your OU4+4).
    You may need to resize the terminal window to 80 columns by 40 rows.
2. If you cannot log in to ssh.ou.edu, try logging in to:
   polk.ou.edu
   It turns out that ssh.ou.edu is an alias for some PCs that are named for dead presidents:
   when you log in to ssh.ou.edu, you’ll actually get logged into one of these.

3. Once you log in, you’ll get some text, and then a Unix prompt — perhaps a greater-than sign,
   a percent sign or a dollar sign, maybe preceded by other text — with the text cursor after it,
   like so:
   >
   (The text cursor will probably be green.)
   If there is information before the prompt character, it might be the name of the computer that
   you’ve logged in to (which may be different from ssh.ou.edu), and/or your user name, and/or other
   information. For purposes of CS1313 course materials, we’ll generally use the
greater-than sign > to indicate the Unix prompt.

4. Check the lines of text immediately above the Unix prompt. If there are lines of text that
   read something like:
   No directory /oushomes/Student/yourusername!
   Logging in with home = "/".
   then you should log out immediately by entering exit at the Unix prompt (you may have
   to do this twice to log out fully), and then log back in.

5. Check to be sure that you’re in your home directory (a directory in Unix is like a folder in
   Windows, and your home directory in Unix is like your desktop in Windows):
   > pwd
   /oushomes/Student/yourusername

   NOTES:
   • All Unix commands MUST be followed by pressing the ENTER key.
   • DON’T type the greater than symbol >, which indicates the Unix prompt, and thus
     ISN’T part of the pwd command.

   The pwd command is short for “Print working directory;” that is, “print the full name of
   the directory that I’m currently in.”

   If your current working directory is just a slash (which means the root directory, which
   is like C:\ in Windows), rather than something like
   /oushomes/Student/yourusername
   then you should log out immediately by entering exit at the Unix prompt (you may have
   to do this twice to log out fully), and then log back in.

   You may find that your home directory is something like:
   /oushomes/FacStaff/yourusername
   This is fine, and most likely is because you either currently work for OU or have worked for
   OU in the past.
II. SET UP (FIRST TIME LOGGING IN ONLY)

1. At the Unix prompt, type **EXACTLY** the bold text below, **EXCLUDING** the greater-than sign, which indicates the Unix prompt (all Unix commands **MUST** be followed by pressing **Enter**):

   > cp ~neem1883/DOT_student/.[a-z]* ~

   This command means: “Copy, from a subdirectory of Dr. Neeman’s home directory, specifically the subdirectory named DOT_student, all files whose filenames start with a dot (period .) followed by a lower case letter followed by any number of any characters, into my home directory. You **WON’T** have to do this for future logins.

   **NOTICE:**
   - The Unix copy command is cp.
   - The first filename or directory name after cp is the source (the thing that you’re making a copy of); the second filename or directory name is the destination (the name and/or location of the copy).
   - Dr. Neeman’s account name on the IT Linux computers is neem1883, **NOT** hneeman.
   - In Unix, filenames are case sensitive, meaning that it matters whether you use upper case (capital) or lower case (small) for each letter in a filename.
   - In Unix, filename pieces are separated by slashes, **NOT** by backslashes as in Windows.
   - The symbol ~ (known as a tilde, pronounced “TILL-duh”) denotes your home directory (another way to denote your home directory is ~yourusername).
   - The substring ~neem1883 means “the home directory of the user named neem1883.”
   - If for some reason this doesn’t work, try

   cp /oushomes/FacStaff/neem1883/DOT_student/.[a-z]* ~

2. Enter the following command:

   > source ~/.profile

   This command means: “Execute the Unix commands that are in the file named .profile, which is in my home directory.” You **WON’T** have to do this for future logins.

3. Create a **subdirectory** named CS1313, like so:

   > mkdir CS1313

   **NOTICE:** In the subdirectory name CS1313, the **CS MUST BE CAPITALIZED**; that is, the directory’s name is “capital-C capital-S one three one three” with no spaces or other characters in between. This command means: “Create a directory named CS1313 as a subdirectory inside the directory that I’m currently in” (it’s like creating a new folder named CS1313 on your desktop in Windows). You **WON’T** have to do this for future logins.

4. Confirm that you have successfully created your CS1313 directory by **listing** the directory’s contents:

   > ls
   CS1313

   This command means: “List the names of the files and subdirectories in my current working directory.” **NOTICE** that the command is “ell ess” — that is, small-L small-S — rather than “one ess” and that ls is short for “list.”
5. Set the permissions on your CS1313 directory so that only you can access it:
   > chmod u=rwx,go= CS1313
This command means: “Change the mode (list of permissions) on my subdirectory named CS1313 so that I (the user) can read files in it, write files in it, and go into (execute) it, but nobody else can.” Your CS1313 directory is now accessible only to you. The only other people who can access it are the system administrators (sysadmins for short) of these computers; that is, IT staff. The instructor, the TAs and your CS1313 classmates CANNOT access your CS1313 subdirectory. You WON’T have to do this for future logins.

6. Log out of the Linux computer by entering exit at the Unix prompt (you may have to do this twice to log out fully). Once you have completed the setup steps in this section, you WON’T have to do them again when you log in later.
III. COPY PP#1 FILES FROM DR. NEEMAN’S HOME DIRECTORY TO YOURS

1. Log in again.

2. Check to be sure that you’re in your home directory:
   
   ```
   > pwd
   /oushomes/Student/yourusername
   ```

3. List the files in your home directory, especially to be sure that you have a CS1313 subdirectory in your home directory:
   
   ```
   > ls
   CS1313
   ```
   [There may be other files and subdirectories listed as well.]

4. Go into your CS1313 subdirectory:
   
   ```
   > cd CS1313
   ```
   This command means: “Change the working directory to CS1313, which is a subdirectory of the current working directory.” (This is like double-clicking on a folder icon in Windows.)
   
   **NOTE:** ALL CS1313 project files MUST reside in your CS1313 subdirectory, for this and ALL future programming projects.

5. Check to be sure that you’re in your CS1313 subdirectory:
   
   ```
   > pwd
   /oushomes/Student/yourusername/CS1313
   ```

6. List the files in your CS1313 subdirectory in your home directory:
   
   ```
   > ls
   ```
   [There may be files and subdirectories listed.]

7. **ASIDE:** To learn more about a particular Unix command, type:
   
   ```
   > man commandname
   ```
   For example, try
   
   ```
   > man chmod
   ```
   which will give you the online manual page for the chmod command. The output of man goes through another command, more, which shows one screenful at a time. To get the next screenful, press the spacebar; to get the next line, press [Enter]. To quit more, press [Q].

8. Copy the C source file named my_number.c from Dr. Neeman’s home directory into your CS1313 directory:
   
   ```
   > cp ~neem1883/my_number.c .
   ```
   This command means: “Copy the C source file named my_number.c from Dr. Neeman’s home directory into the directory that I’m currently in.” **NOTICE THE PERIOD** at the end of this command; it means “the directory that I’m currently in” and is VERY IMPORTANT.

9. Confirm that you have my_number.c in your CS1313 directory by listing the directory’s contents:
   
   ```
   > ls
   my_number.c
   ```
   This command means: “List the names of the files and subdirectories in my current working directory.” **NOTICE** that the command is “ell ess” — that is, small-L small-S — rather than “one ess” and that ls is short for “list.”

8
10. Copy the *makefile* named `makefile` from Dr. Neeman’s home directory into your CS1313 directory:

```
> cp ~neem1883/makefile .
```

Again, notice the period at the end of this command.

11. Confirm that you have `makefile` in your CS1313 directory by listing the directory’s contents:

```
> ls
makefile  my_number.c
```

12. **NOTE:** You **WON’T** do this kind of copying for future programming projects; in future you will write your own programs, typically starting from an empty source file.
IV. LOOK AT, MAKE (COMPILE) AND RUN THE ORIGINAL VERSION OF THE PROGRAM

1. If necessary, repeat III.1-4, then definitely repeat III.5-6.

2. For your own understanding, look at the contents of the C source file:
   
   ```
   > cat my_number.c
   ```
   
   This command means: “Output the contents of the text file named `my_number.c` to the terminal screen.” **NOTICE** that the command to output the contents of a text file to the terminal screen **without** using the `more` command is `cat`, which is short for “concatenate,” a word that means “output one text file after another in sequence.” The output of the `cat` command goes to the terminal screen, and in this case, we are only concatenating a single text file, so we’re simply outputting the text file’s contents to the terminal screen. If the contents of the file exceeds the height of the PuTTY window, then you can scroll up or down using the scrollbar on the right side of the window.

3. For your own understanding, look at the contents of the makefile:
   
   ```
   > cat makefile
   ```

4. **Make** (compile) the **executable** program for Dr. Neeman’s original version of `my_number.c`:
   
   ```
   > make my_number
   gcc -o my_number my_number.c
   ```

   **NOTICE:**
   - In the `make` command, the **command line argument** `my_number` is the name of the **executable** (the file that can actually be run) that you are making.
   - The `make` command runs the C compiler `gcc` to compile the source file named `my_number.c`. In the compile command, the **command line option** `-o my_number` indicates that `my_number` is to be the name of the executable; if that option had been left out, then by default the name of the executable would be `a.out` (“the output of the assembler”), **WHICH WOULD BE BAD.**
5. Once you have successfully compiled Dr. Neeman’s original version of the program, **RUN** the executable several times, using the following values as inputs, in this order:

(a) an integer value less than 1;
(b) an integer value greater than 10;
(c) an integer value between 1 and 10 (inclusive), but far from 5;
(d) an integer value close to 5 (within 1);
(e) 5 (the correct value).

In Unix, you run an executable by entering the name of that executable at the Unix prompt:

> my_number

The sequence of runs will look similar to this:

> my_number
| Let’s see whether you can guess the number that I’m thinking of. |
| It’s between 1 and 10. |
| What number am I thinking of? |
| 0 |
| Hey! That’s not between 1 and 10! |
> my_number
| Let’s see whether you can guess the number that I’m thinking of. |
| It’s between 1 and 10. |
| What number am I thinking of? |
| 11 |
| Hey! That’s not between 1 and 10! |
> my_number
| Let’s see whether you can guess the number that I’m thinking of. |
| It’s between 1 and 10. |
| What number am I thinking of? |
| 2 |
| Bzzzt! Not even close. |
> my_number
| Let’s see whether you can guess the number that I’m thinking of. |
| It’s between 1 and 10. |
| What number am I thinking of? |
| 6 |
| Close, but no cigar. |
> my_number
| Let’s see whether you can guess the number that I’m thinking of. |
| It’s between 1 and 10. |
| What number am I thinking of? |
| 5 |
| That’s amazing! |
V. EDIT THE C SOURCE FILE TO CREATE YOUR OWN UNIQUE VERSION

1. If necessary, repeat III.1-4, then definitely repeat III.5-6.

2. Now that you’ve run Dr. Neeman’s original version of the program, it’s time to modify your copy of the source file my_number.c to create a version that’s uniquely yours. Using the text editor named nano, edit your copy of my_number.c:

   `> nano my_number.c`

   This command means: “Edit the text in the file named my_number.c that’s in my current working directory, using the text editor program named nano.” Your TA will be happy to help you learn how to use the nano editor, and you can also find links on the CS1313 website to webpages describing how to use nano. These links are near the bottom of the page, in the section titled “Useful Information.” If you’d prefer to use another editor (for example, vi, emacs), you may do so, but your TA won’t have time to help you learn it. UNDER NO CIRCUMSTANCES SHOULD YOU EDIT FILES ON A WINDOWS COMPUTER IF THEY ARE TO BE USED ON A UNIX COMPUTER. Windows editors often embed invisible special characters in text files, and some Unix compilers choke on them.

3. In nano, notice the little help messages at the bottom of the screen:

   `^G Get Help ^O WriteOut ^R Read File ^Y Prev Pg ^K Cut Text ^C Cur Pos`
   `^X Exit ^J Justify ^W Where is ^V Next Pg ^U UnCut Text ^T To Spell`

   For example, consider `^W Where is`
   This means that you should press `^C` (the caret `^` indicates the `Ctrl` key) to search for a particular string of characters. Another example: `^C Cur Pos` is short for “Cursor Position” and causes nano to tell you what line number the cursor is located at. Another example: `^K Cut Text` means “delete the line that the cursor is currently on.”

4. Using the text editor, make the following changes to my_number.c:
   (a) In the comment block at the top of the C source file, change the author name and e-mail address, and the lab information, so that they are your information.
   (b) Save (see V.5, below), exit nano (see V.10, below), compile (see IV.4, above), run (see IV.5, above). This will test your first set of edits.
   (c) In the declaration section, change the constant values that the following named constants are initialized to:

      ```
      minimum_number
      maximum_number
      close_distance
      computers_number
      ```

   You may select any integer values that you want, as long as they are different from 1, 5, 10 and 1 respectively, and

   ```
   minimum_number < computers_number < maximum_number
   ```

   and they are sufficiently spread out that you can actually do the runs properly.
   (For example, 2, 4, 2 and 3 won’t work, because anything close to 3 would be outside the range of 2 to 4.)
   (d) Save, exit nano, compile, run. This will test your second set of edits.
(e) In the execution section (also known as the body of the program), change the following sequences of character text to your own words:

i. Hey!

ii. That’s amazing

iii. Close, but no cigar.

iv. Bzzzt! Not even close.

**NOTE**: You are welcome to say pretty much anything you want, but please avoid foul or inappropriate language. Please be entertaining; we’ll have a lot of these to grade.

(f) Save, exit nano, compile, run. This will test your final set of edits.

5. Every few minutes while you’re editing, you should save the work that you’ve done so far, in case your work is interrupted by a computer crashing. In nano, type [Ctrl]-[O] (the letter oh), at which point nano will ask you, near the bottom of the screen:

File Name to write : my_number.c

That is, nano wants to know what filename to save the edited text into, with a default filename of my_number.c. Press [Enter] to save to the default filename my_number.c.

6. A character string literal constant, also known as a character string literal or a string literal for short, is a sequence of characters between a pair of double quotes. For example, in the printf statement

```
printf("This is a printf statement.\n");
```

the following is a string literal:

```
"This is a printf statement.\n"
```

We say that the pair of double quotes delimits the sequence of characters in the string literal. Note that the \n at the end of the string literal tells the program to print a carriage return (also known as a newline) at the end of the line of output text.

7. The lines of text in the C source file my_number.c MUST be less than 80 characters long, and ideally no more than 72 characters long. (Your PuTTY window MUST be 80 characters wide.)

8. Some text editors, including nano, try to help keep text lines short, by breaking a long line into multiple short lines. For example, nano might break a line like

```
printf("This is a long line and nano will probably break part of it off.\n");
```

into two separate lines:

```
printf("This is a long line and nano will probably break part of it off.\n");
```

That is, nano automatically puts a carriage return when the line starts getting too long for nano’s taste. Unfortunately, the C compiler will consider this to be an error. Why? Because C cannot allow an individual string literal to use more than one line. So, the correct way to write the above example is:

```
printf("This is a long line and nano will probably");
printf(" break part of it off.\n");
```
9. Like the lines of C source text, the lines of output text **MUST** be less than 80 characters long, and ideally no more than 72 characters long. You can break a long line of output text into shorter pieces by making it into two `printf` statements. For example:

```c
printf("Why you big old stinker! That’s not between %d and %d!\n", minimum_number, maximum_number);
```

This single `printf` statement can be converted into two `printf` statements, like so:

```c
printf("Why you big old stinker! That’s not between\n");
printf(" %d and %d!\n", minimum_number, maximum_number);
```

10. After you’ve finished editing, exit the text editor. To do this in `nano`, type **[Ctrl]-X**. If you have made any changes since the last time you typed **[Ctrl]-O** then `nano` will ask you, near the bottom of the screen,

```
Save modified buffer (ANSWERING "No" WILL DESTROY CHANGES) ?
```

To save your most recent changes to the file (which is probably what you want to do), press the **Y** key; to avoid saving your most recent changes, press the **N** key. After that, `nano` will behave the same as if you had typed **[Ctrl]-O**.
VI. MAKE (COMPILE), RUN AND DEBUG YOUR OWN UNIQUE VERSION OF THE PROGRAM

1. If necessary, repeat III.1-4, then definitely repeat III.5-6.

2. Make (compile) your own unique version of the executable program:

   `> make my_number
   gcc -o my_number my_number.c`

3. If the program doesn’t compile, then you’ll need to edit it and figure out where things went wrong. **ALWAYS FIX THE FIRST ERROR FIRST** — often, some or all of the remaining error messages are side effects of the first error, and will disappear after you fix the first error.

4. In the worst case, if you’re totally stumped, then copy the original from Dr. Neeman’s home directory again (see III.8), and start editing the fresh copy.

5. Once you have the program compiled, run `my_number` five times, using the following values as inputs, in this order:

   (a) an integer value less than your value for `minimum_number`
   (b) an integer value greater than your value for `maximum_number`
   (c) an integer value between your value for `minimum_number` and your value for `maximum_number` (inclusive), but far from your value for `computers_number`
   (d) an integer value close to your value for `computers_number` (that is, within your value for `close_distance` of your value for `computers_number`)
   (e) your value for `computers_number`

   It’ll look similar to the runs you did with Dr. Neeman’s original version of the program.

6. If the program doesn’t run, or if it runs incorrectly, then just as in Step VI.3 above you’ll need to edit it and figure out where things went wrong. Again, in the worst case, if you’re totally stumped, then copy the original from Dr. Neeman’s home directory again (see III.8), and start editing the fresh copy.
VII. CREATE A SCRIPT FILE

1. If necessary, repeat III.1-4, then definitely repeat III.5-6.

2. Once the program compiles and runs properly, then you’re ready to create a script file, which is a record of your interactions with the computer. Start the scripting session:

   > script pp1.txt
   Script started, file is pp1.txt

   Starting a scripting session is like turning on a tape recorder: every keystroke that you input (including backspaces) and every character that the computer outputs will be recorded into the script file, until you terminate the scripting session (see below).

   NOTICE: pp1.txt means “the text file that contains Programming Project #1.” Thus, the filename is small-P small-P one dot small-T small-X small-T, which is to say small-pea small-pea one dot small-tee small-ex small-tee. Notice that the third character in the filename is the digit one, NOT lower case L.

   IMPORTANT: DON’T use the name of the executable in the name of the script file.

3. Print the working directory:

   > pwd
   /oushomes/Student/yourusername/CS1313

4. List the contents of the directory, using the long listing -l option:

   > ls -l
   -rwxr-xr-x 1 5013 100 13717 Aug 27 18:27 my_number
   -rw-r--r-- 1 5013 100 2976 Aug 27 19:10 my_number.c

   NOTICE that the command is:
   ell ess space hyphen ell
   (lower case L, lower case S, space, hyphen, lower case L).
   It is NOT NOT NOT
   ell ess space hyphen one
   which would be WRONG WRONG WRONG!!!

5. Output your makefile to the terminal screen:

   > cat makefile
   This command will cause the contents of makefile to be sent to the terminal screen, and also to be saved in pp1.txt, the script file.

6. Output your C source file to the terminal screen:

   > cat my_number.c
   As above, this command will cause the contents of my_number.c to be sent to the terminal screen, and also to be saved in pp1.txt, the script file.

7. IMPORTANT! IMPORTANT! IMPORTANT! IMPORTANT! IMPORTANT!
   Clean out any old executables:

   > make clean
   If you don’t clean out your old executable, or if the compile command isn’t shown as a result of cleaning and then making, or if the compile command fails with error messages, then you haven’t proven that your program compiles properly, so YOU WILL LOSE UP TO HALF THE TOTAL VALUE OF THE PROJECT.
8. **IMPORTANT! IMPORTANT! IMPORTANT! IMPORTANT! IMPORTANT!**
    Make (compile) your executable program:
    ```
    > make my_number
    ```
    If you don’t make your executable program, or if the compile command isn’t shown as a result of cleaning and then making, or if the compile command fails with error messages, then you haven’t proven that your program compiles properly, so **YOU WILL LOSE UP TO HALF THE TOTAL VALUE OF THE PROJECT.**

9. Run `my_number`, using the same number of runs with the same input values in the same order as you used in your test in Step VI.5, above.

10. Terminate the scripting session:
    ```
    > Ctrl-D
    ```
    Script done, file is pp1.txt
    This is like turning off the tape recorder.

11. You should now have a script file named `pp1.txt` that contains a complete record of the scripting session. Check to be sure that you have the file:
    ```
    > ls
    ```
    makefile  my_number  my_number.c  pp1.txt

12. Enter the following command at the Unix prompt:
    ```
    > dos2unix pp1.txt
    ```
    This command will clear out some of the invisible special characters from `pp1.txt` (but unfortunately not all of them).

13. From this point on, you are **ABSOLUTELY FORBIDDEN** to alter your script file **IN ANY WAY, EVER.** This will be true for all future Programming Projects.
VIII. PRINT YOUR SCRIPT FILE

Print your script file. The recommended way to print is from a PC in Carson 205, 206 or S-18.

1. Use the same instructions as in I.I.a.ix.A-F to download PSFTP to the Windows PC you’re on and run it.

2. At the `psftp` prompt, enter:
   ```
   open ssh.ou.edu
   ```

3. At the `login as` prompt, enter your OU4+4 username.

4. At the `password` prompt, enter your OU4+4 password. **NOTHING WILL APPEAR AS YOU TYPE YOUR PASSWORD.** This is normal for Unix.

5. At the `psftp` prompt, enter:
   ```
   pwd
   ```

6. At the `psftp` prompt, enter:
   ```
   ls
   ```

7. At the `psftp` prompt, enter:
   ```
   cd CS1313
   ```

8. At the `psftp` prompt, enter:
   ```
   pwd
   ```

9. At the `psftp` prompt, enter:
   ```
   ls
   ```

10. At the `psftp` prompt, enter:
      ```
          lcd C:\Users\yourusername\Desktop
      ```
      **NOTE:** The command is lower case LCD (ell cee dee); the first character **ISN’T** a one.

11. At the `psftp` prompt, enter:
    ```
        get pp1.txt
    ```
    **NOTE:** The filename is lower case PP1 (pea pea one); the last character **IS** a one.

12. At the `psftp` prompt, enter:
    ```
        exit
    ```
    (Or, click on the little X in the upper right of the PSFTP window.)

13. On your Windows desktop, minimize all of the windows on your desktop, and find the icon for `pp1.txt` (which might just say `pp1`, with an icon showing several lines, representing lines of text).

14. Right click on the icon for `pp1.txt` and in the popup menu select:
    ```
        Open with
    ```

15. That’ll pop up another menu, in which select:
    ```
        WordPad
    ```
16. In the WordPad window, in the **Home** tab, to the right, in the **Editing** section, click on **Select All**
   This will highlight all of the text.

17. Toward the left in the **Font** section, set the font to **Courier New** (which is a “fixed width” font appropriate for computer programs), and set the size to **10**.

18. In the WordPad window, in the upper left, click on: **File**

19. In the popup menu, select: **Page Setup**

20. This will pop up the **Page Setup** window. In the section on **Margins**, set all of the margin widths to **1**.

21. In the **Page Setup** window, click: **OK**

22. In the WordPad window, in the upper left, click on: **File**

23. In the popup menu, click on: **Print**

24. In the **Print** popup window, in the (first) section titled **Select Printer**, click on: **Microsoft Print to PDF**

25. At the bottom of the **Print** window, click on: **Print**

26. This will pop up a window titled **Save Print Output As**. On the left side, click on: **Desktop**

27. Set the filename to: **pp1**
   (The extension **.pdf** will be added automatically.)

28. Open up your preferred e-mail client for using your official OU e-mail address (for example, **Outlook365**).

29. Create a new e-mail, with the file you want to print (in this case, **pp1.pdf**) as an attachment.
   **NOTE:** Look **CAREFULLY** at the icon the file you want to attach, to make sure that it’s a PDF file.

30. Send that e-mail to: **print@wepanow.com**

31. Shortly after, you’ll get a reply e-mail from **print@wepanow.com** with a Release Code.
32. Go to the Wepa printer on the first floor of Carson, near the center stairwell.

33. On the Wepa print display, below Insert your Sooner Card, tap on:
   I have a Wepa Code

34. Tap on:
   Submit

35. If necessary, tap the relevant document so that it has a checkmark by it.

36. Tap the big icon that says:
   Print

37. Select the payment method and follow the instructions to pay for your printing.

38. Collect your printout.

39. If necessary, tap on:
   Tap to log out

If you’d prefer to print from another location (for example, from your PC at home), then you’ll need to download your script file to the computer that you want to print from.

For a Windows PC, using the information above, through step VIII.26, then print via your preferred printer in the way you usually print from that printer.

For a MacOS or Linux PC, go to the CS1313 website, scroll down to near the bottom to the section titled “Useful Information,” click on the link that says “Downloading a Secure Copy Client to Your Desktop” and follow the instructions.

When you’re done, close the WordPad window (for example, by clicking the X button in the upper right corner of the WordPad Window), and then log out of both the Linux computer and the Windows PC.
IX. WHAT TO SUBMIT: COVER PAGE, SUMMARY ESSAY, SCRIPT, UPLOADING

1. **COMPOSE AND PRINT OUT** the following items, using a word processor, text editor or typewriter (you are **ABSOLUTELY FORBIDDEN** to submit these items written by hand):

   (a) A cover sheet with the following information:

   i. Project number and name
   ii. Course number, name, year and semester
   iii. Author name and e-mail address
   iv. Lab section, day and time

   For example:
   **Project #1: Thinking of a Number**
   **Class:** CS 1313 010 Programming for Non-majors, Fall 2018
   **Author:** Kim Lee (kimlee@ou.edu)
   **Lab:** Section 014 Fridays 2:30pm
   **NOTICE** that this information is the same as in the comment block at the beginning of my_number.c.

   (b) A summary essay about the project, in your own words.
   For each CS1313 programming project, the summary essay will be worth **AT LEAST 10% OF THE PROJECT’S TOTAL VALUE** (that is, a full letter grade) and **MUST** cover the following points, with a **SECTION HEADER** for each:

   i. The **nature** of the problem to be solved — typically a restatement, in your own words, of the description of the Programming Project that is found in the early paragraphs of the Programming Project specification.

   ii. An abstract description of the **method** of solving the problem that you used — typically a description of how the program behaves, though in the case of PP#1 you may alternatively describe the method as following the steps in the PP#1 specification.

   iii. A list of the concrete **steps** by which you implemented your method (in the case of PP#1, you may list the major sections of the project)

   iv. The **issues and problems** that you had to address during implementation

   v. The **concepts** that you learned from this project

   vi. **References** as appropriate: EVERY summary essay **MUST** end with a clearly labeled references section, which may be marked “none” if there are no references.
   For PP#1, the summary **MUST** be at least half a page single spaced, or a full page double spaced, with a font of 10 to 12 points, and with margins of 3/4 inch to 1 inch on all sides. For future programming projects, the summary may need to be longer.

   **NOTE:** The cover **MUST** be on a **SEPARATE** sheet of paper from the summary essay.

2. **Bind** the paper copies of the materials in the following order:

   (a) the cover sheet (on top);
   (b) the summary essay (in the middle);
   (c) the pages of the script file in order (on the bottom);
   (d) the bottom half of the extra credit form (at the very bottom), if applicable (see below).

   Bind them in the above order with at least an adequate staple or heavy duty binder clip. No paper clips, duct tape, brightly colored yarn, etc.
3. You **MUST** also upload BOTH your **C source file** `my_number.c` and your **script file** `pp1.txt` electronically to the PP#1 dropbox on OU’s Canvas website. **The exact same lateness rules apply to Canvas submissions as to paper submissions** (see the CS1313 syllabus for lateness policy details). This uploading will be worth at least 5% of your grade (that is, half a letter grade) on this and each future programming project.

(a) Download your **C source file** `my_number.c` using the same procedure as in step VIII.2-11 (after running PSFTP).

(b) Using the Microsoft Edge web browser, go to:

   `http://canvas.ou.edu/

   Note that other web browsers such as Firefox sometimes have problems with Canvas.

(c) Log in; your username will be your OU4+4, and your password will be the password for your OU4+4.

(d) Find and click on the link for

   **C S-1313-010 Fall 2018**

   You may need to click on the

   **Courses**

   button on the left side of the window, scroll down to the bottom of that menu, and click

   **All Courses**

   and then click on

   **C S-1313-010 Fall 2018**

   (or it might be listed as **CS1313** or similar).

(e) Near the left side of the page, in the vertical stack of words, click on

   **Assignments**

   (f) You should see a list titled **Upcoming Assignments**; click on the assignment associated with the current Programming Project — in this case:

   **PP#1**

   (g) You’ll now be on the PP#1 page. On the right hand side of the window near the top will be a button labeled

   **Submit Assignment**

   Click on it.

   (h) This will cause to appear, a bit farther down the webpage, some tabs, one of which is:

   **File Upload**

   If it isn’t already selected, click on it.

   (i) In the **File Upload** tab, click on:

   **Browse**

   (j) This will pop up an internal window titled

   **Open**

   On the left side of the **Open** window, click on:

   **Desktop**
(k) In the main panel of the Open window, double-click on:

`my_number.c`

The file may appear to be named `my_number`, so carefully inspect the little icon associated the left of the filename; if it’s a letter C, then that’s actually `my_number.c`. You can also look at the text to the right of the filename, which typically explains what kind of file it is — you want C Source.

**NOTE:** AVOID `my_number.c~` (with a tilde after the .c), which is the next-to-last version of your source file, NOT the final, compiled version that you want to upload.

(l) Once you’ve chosen the file, it’ll appear in the text box between the label File: and the button labeled

`Browse`

(m) Below that, click on:

**Add Another File**

(n) Repeat the procedure above to find and add your script file:

`pp1.txt`

The file may appear to be named `pp1`, so carefully inspect the little icon associated the left of the filename; if it’s a little box with a bunch of horizontal lines, then that’s actually `pp1.txt`. You can also look at the text to the right of the filename, which typically explains what kind of file it is — you want Text Document.

**NOTE:** AVOID `pp1.pdf` if it’s there.

(o) You **DON’T** need to write a comment in the comment box, but you’re welcome to.

(p) Click the button labeled

`Submit Assignment`

(q) If anything goes wrong, you can use the button labeled

`Re-submit Assignment`

in the upper right of the webpage.

(r) On the right hand side of the webpage (in your web browser), inspect the files that you’ve uploaded, to make sure that they’re the correct files:

`my_number.c`

`pp1.txt`

(s) On the far left of the webpage, near the top, click on the button labeled

`Account`

(t) Log out of Canvas by clicking the button labeled

`Logout`

You will need to upload BOTH your C source file AND your script file for EVERY programming project in CS1313.
EXTRA CREDIT

You can receive an extra credit bonus of 5% of the total value of Programming Project #1 by doing the following:

1. Attend at least one CS1313 help session for at least 30 minutes, through Wed Sep 5.
2. During the help session that you attend, work on CS1313 assignments (ideally PP#1, but any CS1313 assignment is acceptable). **YOU CANNOT GET EXTRA CREDIT IF YOU DON’T WORK ON CS1313 ASSIGNMENTS DURING THE HELP SESSION.**
3. Before you leave the help session, fill out BOTH halves of the form on the last page of this project specification and have the help session leader (instructor or TA) sign BOTH halves. **THE FORM CANNOT BE SIGNED UNTIL IT IS COMPLETELY FILLED OUT, **DON’T** fill it out in pencil or in water-soluble ink.
4. Attach the bottom half of the form to your PP#1 script printout, AFTER the script itself, and keep the top half for your own records.

**NOTE:** This extra credit bonus **WON’T** be available on any other programming project unless explicitly stated so in each project’s specification.
COMMON PROBLEMS

- PuTTY: Remember to select SSH.
- Case sensitivity: Unix and C are case sensitive.
- CS1313 subdirectory: ALL of your CS1313 work should be in your CS1313 subdirectory.
- The dot: Remember the dot at the end of some of the cp commands.
- ls: The command is ell ess, NOT one ess.
- ls -l: The command is ell ess space hyphen ell, NOT ell ess space hyphen one.
- Using Windows: UNDER NO CIRCUMSTANCES SHOULD YOU EDIT FILES ON A WINDOWS COMPUTER IF THEY ARE TO BE USED ON A UNIX COMPUTER.
- Constant values: In the declaration section of my_number.c, when you choose constant values, be sure that the values that you choose allow all of the runs. For example, don’t have the minimum and maximum too close to each other.
- What to change: In the execution section of my_number.c, be sure that the ONLY things you change are the ones specified. DON’T change anything else!
- Editing: Save your work frequently.
- Line lengths in source code: In the execution section of my_number.c, be sure that each line is less than 80 characters long.
- String literals: In the execution section of my_number.c, be sure that each string literal is contained entirely on a single line.
- nano: When editing, if you see a line that ends in a dollar sign, probably that means that the line is too long. Also, be careful of nano putting in extra carriage returns.
- Running the program: Be sure that all outputs are less than 80 characters long.
- Script: Remember to make clean
  Failure to do so will cost you half the value of the project, right off the top.
- Script: Remember to make my_number
  Failure to do so will cost you half the value of the project, right off the top.
- make: The command is
  make my_number
  NOT
  make my_number.c
- Script: Be sure to do the correct number of runs, and in the correct order.
- Printing: Be sure to use the Courier New font in 10 point size.
- Printing: Be sure to set the margins to 1 inch all around.
- PROOFREAD PROOFREAD PROOFREAD your script printout.
- Cover page: Be sure to list all required information.
- Summary essay: Be sure that it’s long enough.
- Summary essay: Be sure that you have a references section, even if you have no references.
- Binding order: Be sure that the parts of the project are bound in the correct order.
- Upload: Be sure to upload the SOURCE file AND the SCRIPT file BUT NOT the executable file.
NOTES

READ THIS PROJECT SPECIFICATION SEVERAL TIMES, CAREFULLY. It is YOUR responsibility to read and comply with EVERY WORD. Failure to follow directions IN EVERY DETAIL will cost you a significant amount of points on this and all assignments. The fact that you didn’t notice something WON’T excuse you from complying with it.

You will use the same basic approach for every programming project in this course. Since your programming projects are 45% of your grade, each one may be worth half a letter grade or more. You’ll want to do them all, and to do them well.

For EVERY programming project, you are expected to keep a copy of your source code and your script file on your IT Linux account THROUGH THE END OF THE SEMESTER until your overall letter grade for the course has been officially posted. NEVER DELETE EITHER FILE! If something goes wrong with your printout, these files will be your only proof that you’ve done the work. In addition, you may be assigned mini-projects that require you to modify a completed project; if you’ve deleted that project, then you may have to do the whole thing from scratch in a very limited amount of time.

We strongly recommend that you DON’T attempt extra, unrequested tasks on any assignment. While doing extra work is admirable in principle, in practice it creates a significant chance that you will be unable to complete the assignment on deadline. Unrequested extra work WON’T gain you extra credit. In some cases we may assign bonus work, which will be worth extra credit and which we encourage you to try; otherwise, it may be foolhardy to complicate a given assignment unnecessarily.

“The perfect is the enemy of the good.” If you have to choose between submitting an imperfect project on time or submitting a perfect project late, CHOOSE CAREFULLY. Remember that you lose the equivalent of TWO LETTER GRADES FOR EACH LECTURE PERIOD that your submission is late. If your program compiles and runs at all, even with errors, it will probably be wiser to submit it on time, rather than to continue to refine it and then submit it late, thereby accruing a lateness penalty.

To be a good programmer, you need the following:

- **Patience**
  Designing, writing and debugging programs takes a lot of time.

- **Persistence**
  Often, you will find yourself stuck without knowing how to proceed; DON’T give up.

- **Pessimism**
  - Just because you have a design, that doesn’t mean it’ll be easy to write the program.
  - Just because you’ve written the program, that doesn’t mean it’ll compile.
  - Just because it compiles, that doesn’t mean it’ll run.
  - Just because it runs, that doesn’t mean it’ll produce the correct answer.
  - Just because it produces the correct answer, that doesn’t mean that the printer works.

- **Practice**
  Just like writing prose, or welding, programming is learned by doing, not by theorizing.

Keep this copy for your records.

CS1313 PROGRAMMING PROJECT #1 BONUS REQUEST FORM

Name ________________________________ Lab ____________
Help Session Date _________________
Help Session Time (Arrive) ____________ Help Session Time (Depart) _________________

Instructor Signature ________________________________

Submit this copy.
In your submission, attach this copy AFTER your script file printout.
If you put this in the wrong place in your submission, then you WON’T get the extra credit.
