This third assignment will give you experience writing programs that involve arithmetic expressions. You will write two short programs. Each program will greet the user, then prompt for and input data from the user, then perform one or more calculations, and then output the result(s) to the user. Therefore, each program body will have a greeting subsection, an input subsection, a calculation subsection, and an output subsection. This project will use the same development process as in Programming Project #2, and will be subject to the same rules and grading criteria, plus some additional criteria. **YOU ARE EXPECTED TO KNOW HOW TO DO MANY OF THESE TASKS WITHOUT HAVING THEM DESCRIBED IN DETAIL.**

The two programs will involve: converting measurements from English to metric units; calculating statistics. Put each of the two programs in a separate source file; you **MUST** name them:

```c
conversions.c  statistics.c
```

**I. WHAT TO DO FIRST**

At the top of your makefile, add entries that look like these:

```bash
conversions: conversions.c
gcc -o conversions conversions.c -lm

statistics:  statistics.c
gcc -o statistics statistics.c -lm
```

(Note the `-lm` which is to say *hyphen small-L small-M*, at the end of each `gcc` command.) **DON’T DELETE PREVIOUS MAKEFILE ENTRIES!**

You **MUST** also put new `rm` commands in the `clean` entry at the bottom of your makefile.

**II. CODE DEVELOPMENT PROCESS**

The process for developing these programs will be the same as described in the PP#2 specification, on page 5 in Section IV, titled “Advice on How to Write a Program,” except that (a) you will do calculations, and (b) you will output the values of different variables than you input into.

Pay close attention to the last numbered list on that page. The only difference between the task list for PP#2 and the process that you will use for PP#3 will be that the two programs in PP#3 will have calculations (the program in PP#2 didn’t), and also which of the variables will be output.

**IMPORTANT IMPORTANT IMPORTANT IMPORTANT IMPORTANT IMPORTANT!!!**

For each program in PP#3, you should follow the directions in the PP#2 specification section IV **EXACTLY**, ignoring the calculation subsection until you have completed the rest of the program. (At this stage, some of the outputs in the output subsection will be garbage.) Once everything except the calculation subsection is written and seems to be working properly, you should then write the calculation subsection. **NOTE THAT YOU WILL DEVELOP EACH PROGRAM OUT OF ORDER, CREATING THE CALCULATION SUBSECTION LAST, EVEN THOUGH IT IS LOCATED IN THE MIDDLE OF THE PROGRAM BODY.**

On the following pages are the specifications of the two programs that you will write.
III.A. CONVERSIONS

According to the Mars Climate Orbiter Mishap Investigation Board Phase I Report, Executive Summary, page 6∗ (Nov 10 1999),

... The MCO ... was lost sometime following the spacecraft’s entry into Mars occultation .... [T]he root cause for the loss ... was the failure to use metric units in the coding of ... software ... used in trajectory models. Specifically, thruster performance data in English units instead of metric units was used in the software application code titled SM_FORCES (small forces). A file called Angular Momentum Desaturation (AMD) contained the output data from the SM_FORCES software. The data in the AMD file was required to be in metric units ... and the trajectory modelers assumed the data was provided in metric units per the requirements. ...

Write a program to convert from English units to metric units,† specifically to convert:

- volume from cubic inches to liters,
  
  AND
  
- fuel burn rate from gallons per second to liters per hour.

For your conversions, use the following constant values AND NO OTHERS, declaring and initializing appropriate named constants (you are ABSOLUTELY FORBIDDEN to combine these in initializations):

- There are 2.54 centimeters per inch.
- There is 1 cubic centimeter per milliliter.
- There are 1000 milliliters per liter.
- There are 4 U.S. quarts per U.S. gallon.
- There are 1.05669 U.S. quarts per liter.
- There are 60 minutes per hour.
- There are 60 seconds per minute.

The program body MUST incorporate the following subsections, IN THE FOLLOWING ORDER:

1. **Greeting Subsection**: Greet the user with useful information about the program.
2. **Input Subsection**
   
   (a) Prompt the user for a volume in cubic inches.
   (b) Input the volume in cubic inches.
   (c) Prompt the user for a fuel burn rate in gallons per second.
   (d) Input the fuel burn rate in gallons per second.

(Continue on to the next page.)

∗https://llis.nasa.gov/llis_lib/pdf/1009464main1_0641-mr.pdf
†http://www.calculateme.com/, https://www.unitconverters.net/
3. **Calculation Subsection**
   (a) Calculate the volume in liters.
   (b) Calculate the fuel burn rate in liters per hour.

4. **Output Subsection**
   (a) Output the volume in both cubic inches and liters.
   (b) Output the fuel burn rate in both gallons per second and liters per hour.

**IMPORTANT:** Volumes and fuel burn rates **AREN'T** constrained to be integers.

**RUNS:** Run this program three times using three different sets of input values. The first run **MUST** use 1000 cubic inches and 1 gallon per second as input values. For the other two runs, you may choose **APPROPRIATE** values to your liking, but each such input value **MUST** differ from the same input in the other runs and from the other input in the same run.
III.B. STATISTICS

Consider a list of \( n \) points:
\[(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)\]

A regression line is a line that represents a general relationship between the \( x_i \) values and the \( y_i \) values. A least squares regression line is the line that minimizes the sum of the squares of the distances between the individual points \((x_i, y_i)\) and the regression line.\(^1\)

For a set of \( n \) points, the least squares regression line \( y = mx + b \) is calculated as follows:

- The slope of the least squares regression line, denoted \( m \), is
  \[
  m = \frac{\left(\sum_{i=1}^{n} x_i y_i\right) - \left(\frac{\sum_{i=1}^{n} x_i \left(\sum_{i=1}^{n} y_i\right)}{n}\right)}{\left(\sum_{i=1}^{n} x_i^2\right) - \left(\frac{\sum_{i=1}^{n} x_i^2}{n}\right)}
  \]

- The intercept of the least squares regression line, denoted \( b \), is
  \[
  b = \frac{\left(\sum_{i=1}^{n} y_i\right) - m \left(\sum_{i=1}^{n} x_i\right)}{n}
  \]

Note: \( \sum_{i=1}^{n} z_i = z_1 + z_2 + \ldots + z_n \)

So:
\[
\begin{align*}
\sum_{i=1}^{n} x_i &= x_1 + x_2 + \ldots + x_n \\
\sum_{i=1}^{n} y_i &= y_1 + y_2 + \ldots + y_n \\
\sum_{i=1}^{n} x_i^2 &= x_1^2 + x_2^2 + \ldots + x_n^2 \\
\sum_{i=1}^{n} x_i y_i &= x_1 y_2 + x_2 y_2 + \ldots + x_n y_n
\end{align*}
\]

Write a program that inputs five \((x, y)\) points, calculates the slope and intercept of their regression line, outputs the values of the five points, and then outputs the equation for their regression line.

The program **MUST** incorporate the following subsections, in the following order:

1. **Greeting Subsection**: Greet the user with useful information about the program.

2. **Input Subsection**
   
   (a) Prompt the user to input the \( x \) and \( y \) value for the first point.
   
   (b) Input the \( x \) and \( y \) value for first point, using a single `scanf` statement.
   
   (c) Prompt the user to input the \( x \) and \( y \) value for the second point.
   
   (d) Input the \( x \) and \( y \) value for second point, using a single `scanf` statement.
   
   (e) Prompt the user to input the \( x \) and \( y \) value for the third point.
   
   (f) Input the \( x \) and \( y \) value for third point, using a single `scanf` statement.
   
   (g) Prompt the user to input the \( x \) and \( y \) value for the fourth point.
   
   (h) Input the \( x \) and \( y \) value for fourth point, using a single `scanf` statement.
   
   (i) Prompt the user to input the \( x \) and \( y \) value for the fifth point.
   
   (j) Input the \( x \) and \( y \) value for fifth point, using a single `scanf` statement.

3. **Calculation Subsection**

(a) Calculate the sum of the \( x_i \) values.
(b) Calculate the sum of the \( x_i^2 \) values.
(c) Calculate the sum of the \( y_i \) values.
(d) Calculate the sum of the \( x_i \cdot y_i \) values.
(e) Calculate the numerator of the slope of the regression line.
(f) Calculate the denominator of the slope of the regression line.
(g) Calculate the slope of the regression line.
(h) Calculate the intercept of the regression line.

4. **Output Subsection**

(a) Output the first point in the form \((x_1, y_1)\).
(b) Output the second point in the form \((x_2, y_2)\).
(c) Output the third point in the form \((x_3, y_3)\).
(d) Output the fourth point in the form \((x_4, y_4)\).
(e) Output the fifth point in the form \((x_5, y_5)\).
(f) Output the equation of the regression line in the form \( y = mx + b \).

**NOTE:** In this program, you are **ABSOLUTELY FORBIDDEN** to use \( x_1, x_2, x_3, x_4, x_5, y_1, y_2, y_3, y_4, \) and \( y_5 \) as variable names for the input values, and you are **ABSOLUTELY FORBIDDEN** to use \( m \) and \( b \) as variable names for the slope and intercept, because they would violate the “favorite professor” rule.

**IMPORTANT:** Regression values are almost always non-integers.

**RUNS:** Run this program three times using three different sets of input values. The first run **MUST** use the following input values:

- \((200,142.125)\)
- \((300,213.5)\)
- \((400,284.375)\)
- \((500,355.875)\)
- \((600,426.75)\)

For the other two runs, you may choose **APPROPRIATE** values to your liking, but each such input value **MUST** differ from the same input in the other runs and from the other inputs in the same run.
IV. ADDITIONAL GRADING CRITERIA

NOTE: ALL grading criteria introduced in any Programming Project apply to ALL future PPs, unless explicitly stated otherwise.

A. Additional Grading Criteria for C Source Code

1. Declaration subsections: Within the declaration section, there MUST be a subsection of named constant declarations, followed by a subsection of variable declarations. These two declaration subsections MUST be clearly labeled by comments, as shown in my_number.c.

2. Declaration subsection order: The named constant declaration subsection MUST appear BEFORE the variable declaration subsection, and therefore ALL named constant declarations MUST appear before ANY variable declarations, as shown in my_number.c.

3. Named constant and variable declaration order: ALL float named constants MUST be declared before ANY int named constants. Likewise, ALL float variables MUST be declared before ANY int variables.

4. Declaration comments: Named constant and variable declarations MUST be preceded by comments clearly explaining the nature and purpose of each declared name, as shown in my_number.c.

5. No mixing of sections and subsections: You are ABSOLUTELY FORBIDDEN to have:
   (a) ANY declarations in your program body;
   (b) ANY inputs or calculations in your greeting subsection;
   (c) ANY calculations, or outputs other than prompts, in your input subsection;
   (d) ANY inputs or outputs in your calculation subsection;
   (e) ANY inputs or calculations in your output subsection.

6. Numeric literal constants are ABSOLUTELY FORBIDDEN in a program’s execution section (body). (They are permitted in the declaration section when initializing variables and named constants.) All numeric constants used in the program body MUST be named constants. There are NO EXCEPTIONS to this rule.

7. Numeric literal constants embedded inside string literals are also ABSOLUTELY FORBIDDEN in the program body; for example, the statement below is NOT acceptable:
   
   ```c
   printf("This is the year 2019.\n"); /* <-- BAD BAD BAD! */
   
   The only exception to this rule is the use of numeric literal constants in placeholder format descriptors.
   
8. Constant names, like variable names, MUST be meaningful, and MUST satisfy the “favorite professor” rule.

9. Constant names that reflect the value of the constant, rather than its purpose, are ABSOLUTELY FORBIDDEN (for example, one and five are NOT ACCEPTABLE as constant names).

10. Assignment statements MUST have the following format: indentation, followed by the name of the variable whose value is being assigned, followed by one or more blank spaces (usually just one), followed by a single equals sign, followed by one or more blank spaces (usually just one), followed by the expression to calculate the variable’s value, followed by the statement terminator.
11. **Expressions in assignment statements** MUST have the following format:

(a) Each operator (for example, + - * /) **MUST** be surrounded on each side by one or more blank spaces.

(b) An open parenthesis **MUSTN’T** have any blank spaces to its right.

(c) A close parenthesis **MUSTN’T** have any blank spaces to its left.

(d) If an expression requires multiple lines of source code text, then each line (other than the last) **MUST** end with an operator (or the single equals sign), and corresponding parts of the expression **MUST** line up. For example:

```plaintext
product_sum =
  independent_variable1 * dependent_variable1 +
  independent_variable2 * dependent_variable2 +
  independent_variable3 * dependent_variable3 +
  independent_variable4 * dependent_variable4 +
  independent_variable5 * dependent_variable5;
slope_numerator =
  product_sum -
  ((independent_variable_sum * dependent_variable_sum) / number_of_points);
```

**B. Additional Grading Criteria for Summary Essays**

You will need to write **TWO SUMMARY ESSAYS**, one for **EACH** of the two programs. Together, they will be worth at least 10% of the project’s total value, and each **MUST** cover the points listed in the specification for Programming Project #1. For this project, each of the two summary essays **MUST** be at least half a page single spaced or a full page double spaced, in a 10 to 12 point font, with margins of 1 inch on each side.

**V. SCRIPTS**

Before creating either of your two script files, thoroughly test and debug both of your programs. Be sure to test them with the input values that you will be required to use in your script files. To ensure that your programs are producing the correct results, calculate the correct results by hand, and compare your hand-calculated values to the associated program output. As you develop your programs, you will compile, run, test and then script each of these programs separately, using the scripting process described in Programming Project #1. You will create two separate script files, one for each of the two programs. **You are ABSOLUTELY FORBIDDEN to use a single script file for both programs.** The script files **MUST** be named:

```
pp3_conversions.txt  pp3_statistics.txt
```

**VI. WHAT TO SUBMIT**

Submit paper materials **bound in the following order**: cover page, conversions summary, conversions script file, statistics summary, statistics script file, bonus checklist (if any), bonus help session form (if any). **NOTE** that you will have **ONLY ONE COVER PAGE**.

If you have difficulty binding together so many pages, either use a large binder clip, or staple each of the two subsets together and then staple the last page of conversions to the first page of statistics. You will also need to **UPLOAD** both source files and both script files to Gradescope.

For this project, you are not required to include idiotproofing checks on the input. It is **YOUR** responsibility to read and comply with all of the grading criteria listed for Programming Projects #1 and #2, as well as the additional criteria for this project.
EXTRA CREDIT

(A) HELP SESSION BONUS EXTRA CREDIT

You can receive an extra credit bonus of as much as 2.5% of the total value of PP#3 as follows:

1. Attend at least one regularly scheduled CS1313 help session for at least 30 minutes, through Wed Oct 2.

2. During the regularly scheduled help session that you attend, work on CS1313 assignments (ideally PP#3, but any CS1313 assignment is acceptable). **YOU CANNOT GET EXTRA CREDIT IF YOU DON’T WORK ON CS1313 ASSIGNMENTS DURING THE HELP SESSION.**

3. Before you leave the regularly scheduled help session, fill out BOTH halves of the form on the last page of this project specification and have the help session leader (instructor or TA) sign BOTH halves. **THE FORM CANNOT BE SIGNED UNTIL IT IS COMPLETELY FILLED OUT IN INK.** Use of pencil on these forms is ABSOLUTELY FORBIDDEN.

4. If you leave the help session without getting the form signed, you CANNOT get extra credit for attending that help session; your form CANNOT be signed later.

5. Attach the bottom half of the form to your PP#3 paper submission, at the VERY END, and keep the top half for your own records.

**VALUE OF THE HELP SESSION EXTRA CREDIT BONUS:**
- for attending a regularly scheduled help session Mon Sep 23 - Wed Sep 25: 2.5% of the total value of PP#3;
- for attending a regularly scheduled help session Mon Sep 30 - Wed Oct 2: 1.25% of the total value of PP#3.

(B) CHECKLIST BONUS EXTRA CREDIT

You can receive an extra credit bonus of up to 2.5% of the total value of Programming Project #3 by doing the following:

1. Print out the checklist on pages 9-10 of this PP#3 specification. You MUST provide the ENTIRE checklist, both pages (preferably double sided on 1 sheet of paper).

2. Complete the checklist, by checking the checkbox for every item that you have performed as described.

3. Include the checklist in your paper submission, as described in this PP#3 specification, page 7, section VI.

**VALUE OF THE CHECKLIST EXTRA CREDIT BONUS:**

2.5% of the total value of PP#3

**NOTES:**
- For the checklist bonus extra credit, if you mark any of the items INCORRECTLY (that is, you said that you did do something that you actually didn’t do), then we reserve the right to decide to reduce or eliminate some or all of the checklist bonus extra credit for PP#3, at our sole discretion.
- You can only get each extra credit bonus ONCE per programming project that offers it.
- These extra credit bonus items WON’T be available on any other programming project unless explicitly stated so in that project’s specification.
**PP#2 CHECKLIST** (Print this checklist, check all that apply, and include this in your paper submission, for up to 2.5% BONUS EXTRA CREDIT.)

**NAME**   

- **Edit makefile:** I edited my `makefile` to add make entries for conversions and statistics, and to update the `clean` entry for both of those programs (as described in the PP#3 specification, page 1, section I).

- **Code development process:** I used the recommended code development process (as described in the PP#3 specification, page 1, section II).

- **Declaration subsections:** My declaration section has two subsections, one for named constants, the other for variables (as described in the PP#3 specification, page 6, grading criterion #1).

- **Declaration subsection labeling comments:** Before my named constant subsection and before my variable subsection, there are comments labeling those subsections (as described in the PP#3 specification, page 6, grading criterion #1).

- **Declaration subsection order:** My named constant declaration subsection comes before my variable declaration subsection, and therefore all my named constant declarations come before any of my variable declarations (as described in the PP#3 specification, page 6, grading criterion #2).

- **Declaration order within each subsection:** In my named constant subsection and in my variable subsection, all `float` declarations come before any `int` declarations (as described in the PP#3 specification, page 6, grading criterion #3).

- **Declaration comments:** In my named constant subsection and in my variable subsection, there are comments clearly explaining each named constant or variable (as described in the PP#3 specification, page 6, grading criterion #4).

- **No mixing of sections or subsections:** In my program, there are no declarations in my execution section (body), no inputs or calculations in my greeting subsection, no calculations in my input subsection (and the only outputs are prompts for inputs), no inputs or outputs in my calculation subsection, and no inputs or calculations in my output subsection (as described in the PP#3 specification, page 6, grading criterion #5).

- **No numeric literal in execution section (body):** In the execution section (body) of my program, there are no numeric literal constants, only named constants (though I do have numeric literal constants in my declaration section) (as described in the PP#3 specification, page 6, grading criterion #6).

- **No numeric literal inside string literals:** In the execution section (body) of my program, there are no numeric literal constants embedded inside string literals (as described in the PP#3 specification, page 6, grading criterion #7).

- **Favorite professor rule for named constants:** The names of my named constants (and of my variables) conform to the favorite professor rule (as described in the PP#3 specification, page 6, grading criterion #8).

- **No named constants named for their own values:** The name of each of my named constants reflects the purpose of that named constant, not the value of that named constant (as described in the PP#3 specification, page 6, grading criterion #9).

- **Assignment statement format:** My assignment statements have the correct format (as described in the PP#3 specification, page 6, grading criterion #10).
Expression format: My expressions (for example, arithmetic expressions on the right hand side of assignment statements) have the correct format (as described in the PP#3 specification, page 7, grading criterion #11).

Two summary essays: I have two summary essays, one for each program (as described in the PP#3 specification, page 7, section IV.B).

Two script files: I have two script files, created in two separate script sessions, one for each program (as described in the PP#3 specification, page 7, section IV.B).

Submission binding order: My paper submission is bound in the correct order (as described in the PP#3 specification, page 7, section V).

Uploads: I have uploaded both source files and both script files to the Canvas PP#3 dropbox (as described in the PP#3 specification, page 7, section VI).
